

TECHNOLOGY DESIGN + ENGINEERING

COMMISSIONING

It is critical that smart buildings operate as designed. Both final testing and third-party commissioning is a critical component to ensure the technology investment meets the operational design intent and business needs.

We provide third-party commissioning services for building low-voltage systems. This includes the development of the systems testing procedures in coordination with the installing contractor during the installation phase of construction. Systems are methodically tested, and deficiencies noted for review and correction to confirm that the system installed conforms to the design parameters of the bid documents.
